For the removal of corns & persistent calluses

- Effective from the first week
- Precise application
- No risk of scarring

What is the Wartner Corn Pen and what is it used for?

The Wartner Corn Pen is a medical device indicated for the treatment of thickened skin or skin lesions such as corns and severe or persistent calluses, which are caused by chronic pressure on the skin (for example, by footwear being too tight). Constant friction induces the multiplication of skin cells which grow into thick and painful lesions. The pen applicator contains a highly concentrated corn removal gel. The gel promotes skin cell turnover which causes skin to peel. As this occurs, the thickened skin / corn will disappear and new healthy skin is regenerated.

Instructions for use

Apply once daily for 4 days. After treating for 4 days, the skin will peel off during the next 4 days. You can carefully remove the peeling skin under lukewarm water. After the treatment, new healthy skin will have formed. The corn may disappear from the first week of treatment.

If the corn does not disappear completely, repeat the treatment after a 4 day break period. You can repeat this treatment schedule up to 4 times. Only one drop of gel is needed per application.
